Concepts Guide

Modernizing System i Applications Using Design Recovery

<http://www.databorough.com/designrecovery>

Cumulative Knowledge Base

R & D Partners

Typical System i Application

- ▶ Hundreds to thousands of RPG or COBOL Programs
- ▶ Aging Systems – 30 to 40 years old, heavily modified
- ▶ Monolithic Programming model
 - Screen
 - Database
 - Business Logic
- ▶ Little or no Documentation
- ▶ Original Designers no longer available

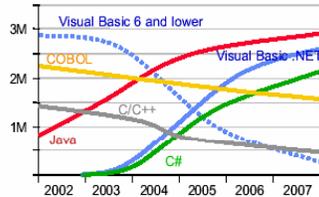

- ∞ Improve the responsiveness of development
- ∞ Improve long term maintainability
- ∞ Increased access to developers skilled in popular languages
- ∞ Increase availability of tools and application packages
- ∞ Improve application accessibility through open interfaces
- ∞ Improve portability of applications across platforms

Why Modernize?

Developers

From an estimated worldwide market size of 7 million "professional" developers

Gartner

Java is Critical for the Industry

The world's most widely used programming platform

What percent of your programming time will you spend using the following languages TODAY? (filtered for responses of 1% or greater)	Population	Percent of Cases
Java	9,007,346	61.6
C/C++	7,194,179	49.2
XML	7,194,179	49.2
C#	5,044,699	34.5
Visual Basic/Visual Basic.NET	4,913,098	33.6
Scripting Languages	10,426,711	71.3
Other	7,428,130	50.8

Global Developer Population and Demographics Survey, Volume I, © 2009 Evans Data Corp.

Developer Population?

Modern vs. Traditional Applications

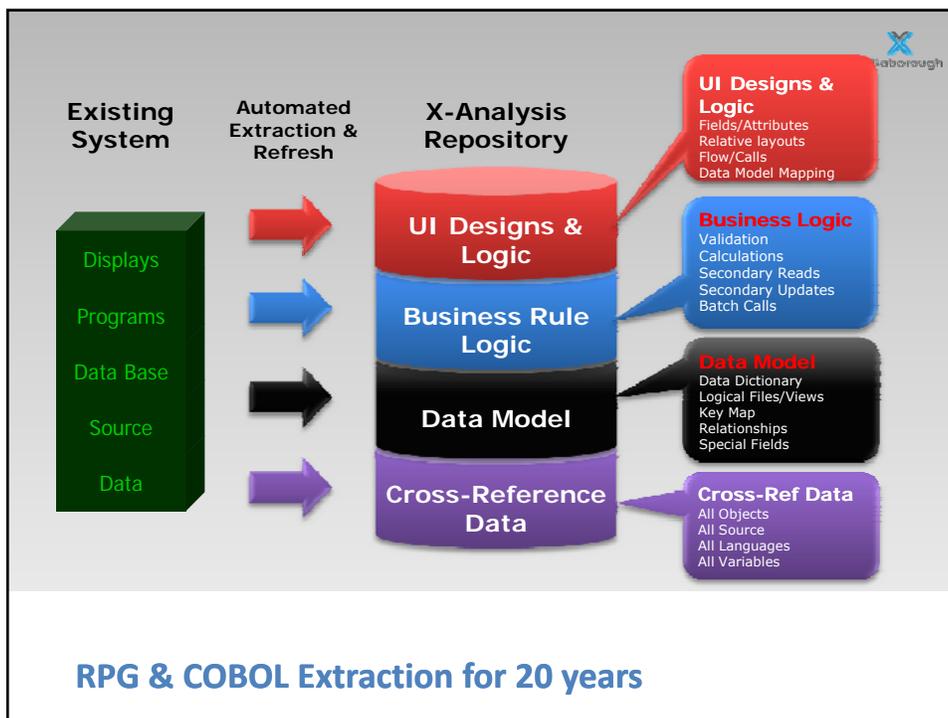

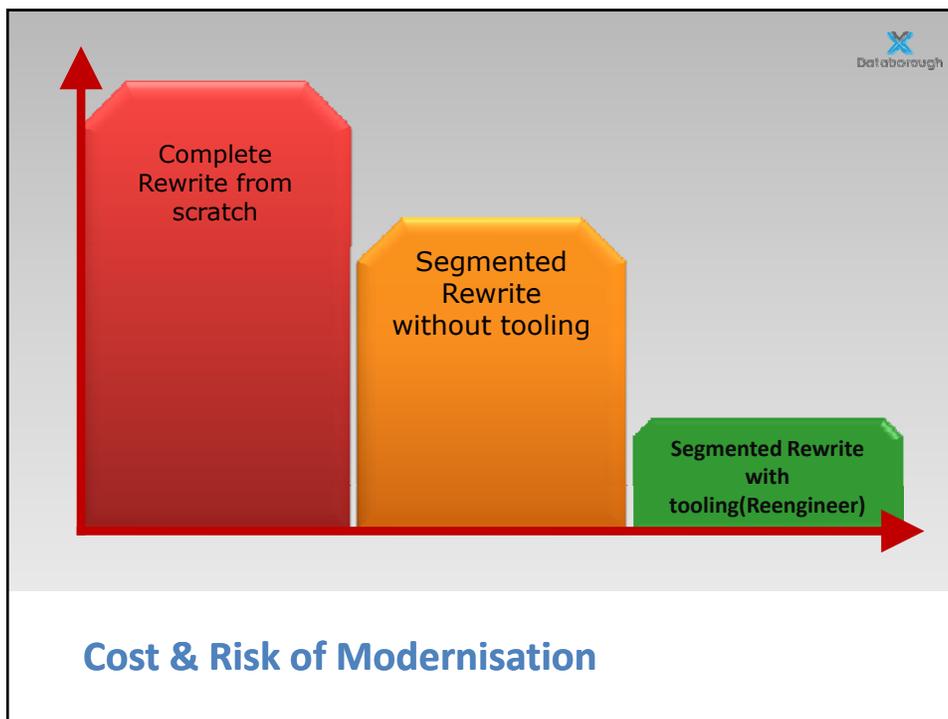

Characteristic	Modern Application	Traditional Application
Structure	Modular, reusable, component based	Monolithic, intertwined, repetitive code across modules
Componentization	Functionally cohesive	Arbitrary
Performance	Highly scalable	Limited scalability
User Interface	Multiple	5250
Portability	Diverse platforms	System i and its predecessors

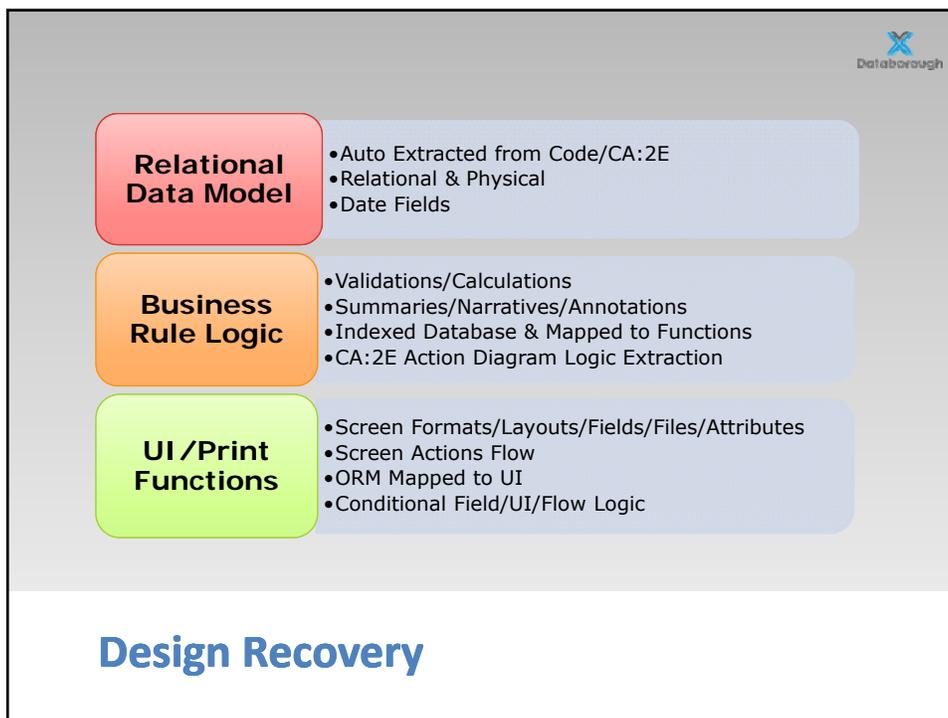

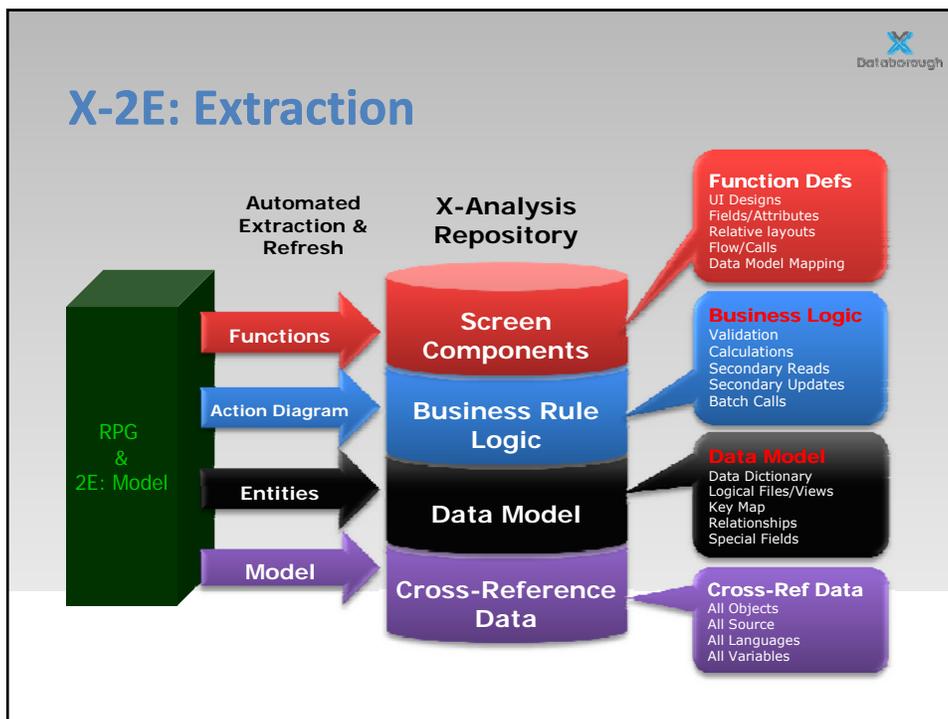

- ☛ Inherit Legacy Problems
- ☛ Not A Modern Application (Actually Legacy Emulation)
- ☛ **No-one recognizes the output**
- ☛ Virtually Un-maintainable
- ☛ Difficult To Retain Staff
- ☛ Poor Performance
- ☛ Difficult to Scale
- ☛ Not a Long Term Investment

Code Conversions

- ∞ Quality of Communication

Summary Benefits of Analysis

What is MVC?

Model-View-Controller (MVC)

- **Model:** Underlying data objects and Business Logic
- **View:** The user interface
- **Controller:** Takes requests from View; passes commands to Model; chooses resulting View

MVC means keeping these functions separate.

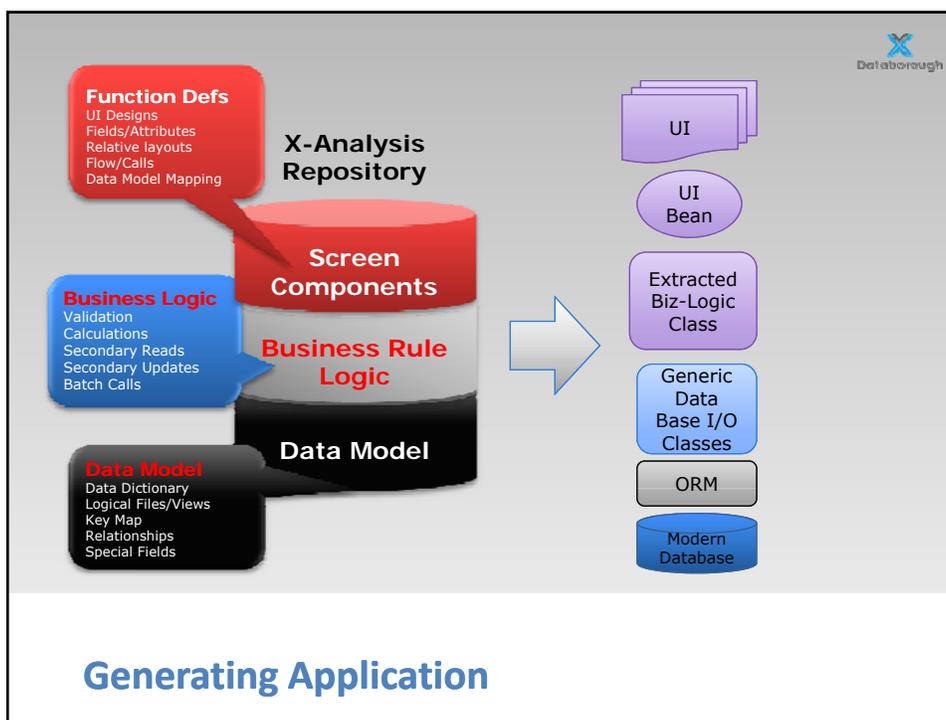

Why MVC?

The shift to MVC

Brian Goldfarb, director of developer and user experience platforms at Microsoft.

"In the same vein, Microsoft has recognized the importance of the MVC pattern to developers, and it views it as a proven, robust way of making applications, The needs of customers have changed now."

- Reduce Maintainable Code Base
- Agile Maintenance
- Consistent Architecture
- Lower Training Costs
- Optimise Performance
- Portability & Scalability
- Modular separation of function
- Easier to maintain
- Data Integrity

- Each Screen Format has business logic indexed
- UI Events Removed from code
- Indicators and UI messaging converted to standard messaging
- I/O Standardised into generic components in Java/C#
- Procedural Code is converted to event driven code
- Standardised Parameters and API's
- Variables Rationalised back to DB Fields if Possible
- Each Screen Format converted to JSF
- Java/EGL Controller Bean/Handler per screen
- Uses a open source/Net application framework as necessary or useful

How is design Re-factored?

Web - JSF JEE MVC

Project Methodology

- **Project Discovery**
- **Proof of Concept**
 - Migration of a defined subset of functionality to primary desired variant. Customer can then inspect and benchmark actual migrated code.
- **Model Preparation**
 - Complete documentation
 - Application Subdivision
 - Model/Application clean-up/refactor
- **Test Case Development**
- **Migration**
- **Training**
- **Global & Specific Customization**

On Going Changes during Project

- **High Level Automation minimises impact of change**
- **Precise impact analysis upfront in tooling**
- **Last minute input**

Testing

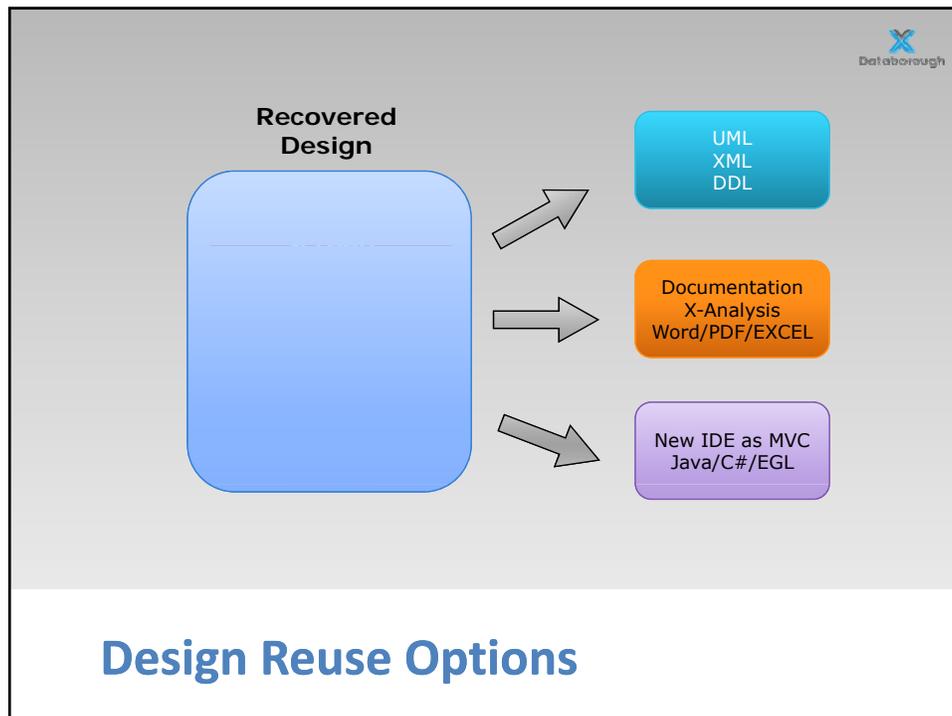

- **Distributed and so focussed and more manageable**
- **Consistency – code is consistent so results are more predictable**
- **Semi automated – OO and Event code model allows for automated unit testing**

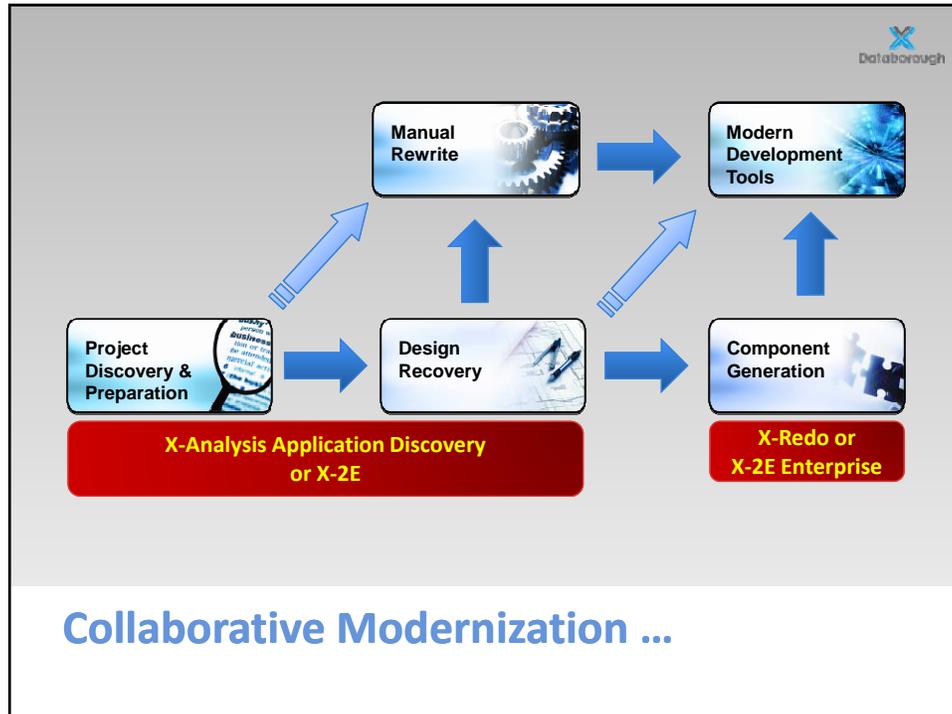

Future Maintenance

- **Potential for Automation – Consistent structure**
- **Distributed Architecture/Modular/Known(you know where to make the change or enhancement)**
- **Object Oriented - reuse**
- **Semi automated – generation from models**

Stability & performance

- **Distributed Architecture**
- **Modular Scalability**
- **Modern frameworks – Hibernate/Spring/nHibernate**
- **Automated benchmarking**

- ∞ **Inherit Valuable Assets**
- ∞ **Exact and Accurate Knowledge Transfer**
- ∞ **Lower Risk**
- ∞ **Re-Use Existing Skills**
- ∞ **Configurable**
- ∞ **Gradual, Granular & Scalable**
- ∞ **Long term result - *maintainable***

Cumulative Knowledge Base

		
		
	 Global Services  Lab Services	
		

Mainstream

- 80's cross referencing tools
- Mid 90's Reengineering Automation
Graphical analysis & Documentation
- Early 00's Model Based Extractions
Data Model
- 2005 Model Based Extractions
Business Rule Logic
- 2005 Model Based Extractions
UML & DDL
- 2009 Database Modernization & Reengineering

Technological Milestones

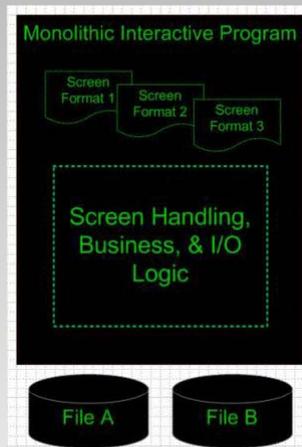

- Application Architecture
- Code Complexity & Growth
- Technology Evolution & Standards
- Knowledge Dispersion & Loss

Defining The problem

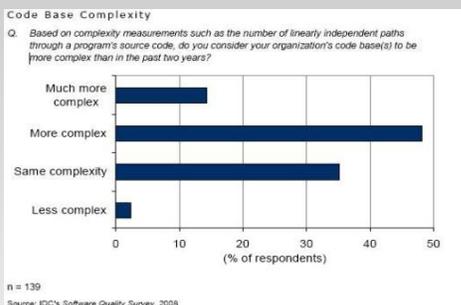

- Monolithic
 - Screen handling
 - Database I/O
 - Business Logic/Conditional Flow
- Inheritance & Erosion
 - Legacy - S36/S38 int/multi-frm/mbr files
 - ERP
 - Acquisition & growth
 - Regulatory

Application Architecture

- In-source, Outsource, Offshore
- Interfacing & Integration
- Regulatory Demands
- Competitive Business Pressures

Code Complexity & Growth

- + RPG II/III/IV/Free
- + GOTO/Indicators/Subroutines/procedures
- + Internally/Externally described files
- + OpenQueryFile/SQL/RLA
- + ILE
- + Naming conventions
- + Documentation/Comments
- + SCM
- + 4GL/Templates/Copying

= Aaaaaahhh!!!

Technology Evolution & Standards

Typical System i Application

-  Hundreds to thousands of RPG or COBOL Programs
-  Aging Systems – 30 to 40 years old, heavily modified
-  Monolithic Programming model
 - oScreen
 - oDatabase
 - oBusiness Logic
-  Little or no Documentation
-  Original Designers no longer available

- Application Discovery
- Refactor
- Automation
- Quick Wins & Rewrites

Resolving The problem

- Documentation
- Visual Analysis
- Functional Subdivision
- Communication
- Validation

Application Discovery

0179.00 E>!BRC endif
    
```

Documentation – Business Rules

The screenshot shows a complex data model interface. On the left, a 'Data Model Diagram' displays various tables and their relationships. The central pane shows a 'Program Centred Data Flow Diagram for ATBDFP' with multiple data flows between objects. On the right, a 'Data Content Diagram' lists fields and their attributes. Below the diagrams, a 'Screen Fields' table provides details for the fields used in the screen.

Label	Field	File	Line	Column	Attribute	Type	Length	Decimal Post
Code	FSM_Code	ASDQREP	4	24	Both	A	6	0
Description	FSM_Description	ASDQREP	5	24	Both	A	50	0
	DTL_Text_21	WorkField	7	2	Output	A	21	0
	FSM_Org_Link_Type_ID	ASDQREP	7	24	Both	A	1	0

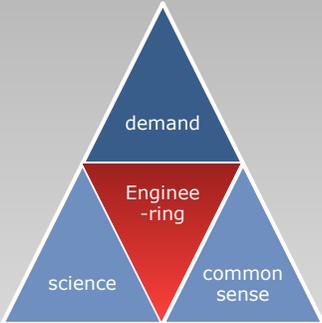

Visual Analysis – Data Model, OWU and field analysis

The screenshot displays the 'Screen Design' and 'Screen Action Diagram' for a specific screen. The 'Screen Design' window shows a terminal-style output of a report. The 'Screen Action Diagram' shows the logic and data flow for the screen's actions. A 'Data Content Diagram' on the right shows the fields and their relationships. A 'Screen Fields' table at the bottom provides details for the fields used in the screen.

Label	Field	File	Line	Column	Attribute	Type	Length	Decimal Post
Code	FSM_Code	ASDQREP	4	24	Both	A	6	0
Description	FSM_Description	ASDQREP	5	24	Both	A	50	0
	DTL_Text_21	WorkField	7	2	Output	A	21	0
	FSM_Org_Link_Type_ID	ASDQREP	7	24	Both	A	1	0

Visual Analysis – Deconstructing UI Layer

Basic Code Refactor

- Create Subroutines and in the process, elimination of GOTO / CAB / TAG statements.
- Replacement of left hand indicators used to control program logic flow with IF, THEN, ELSE type logic statements.
- Removal of primary / secondary file structures – eliminate use of RPG cycle
- Inclusion of D-Spec statements as created by ILE conversion process
- Extraction of messages to a message file format
- Externalization of inline tables (compile time tables/arrays)
- Replacement of left hand indicators with named indicators (to include Level indicators L1-L9, MR, U indicators)
- Consistent use of up-to-date RPG ILE data handling capabilities
- Use of RPG ILE standard functions wherever possible, such as %EOF, %FOUND, %LOOKUP, etc.
- Replacement of ADD, SUB, MULT, DIV with EVAL whenever practical
- Removal (and archival) of commented out code

Database Refactor

- DDS to SQL
- Field Expansions
- UNICODE

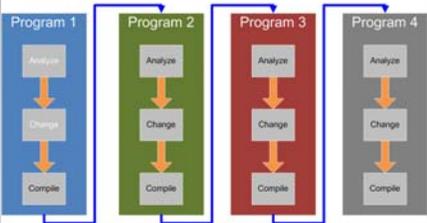

Advanced

- I/O Externalization
- Subroutine to Procedures
- Business Logic Externalization

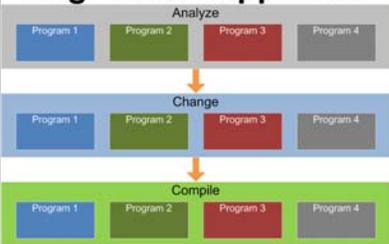

Refactor

Manual Approach

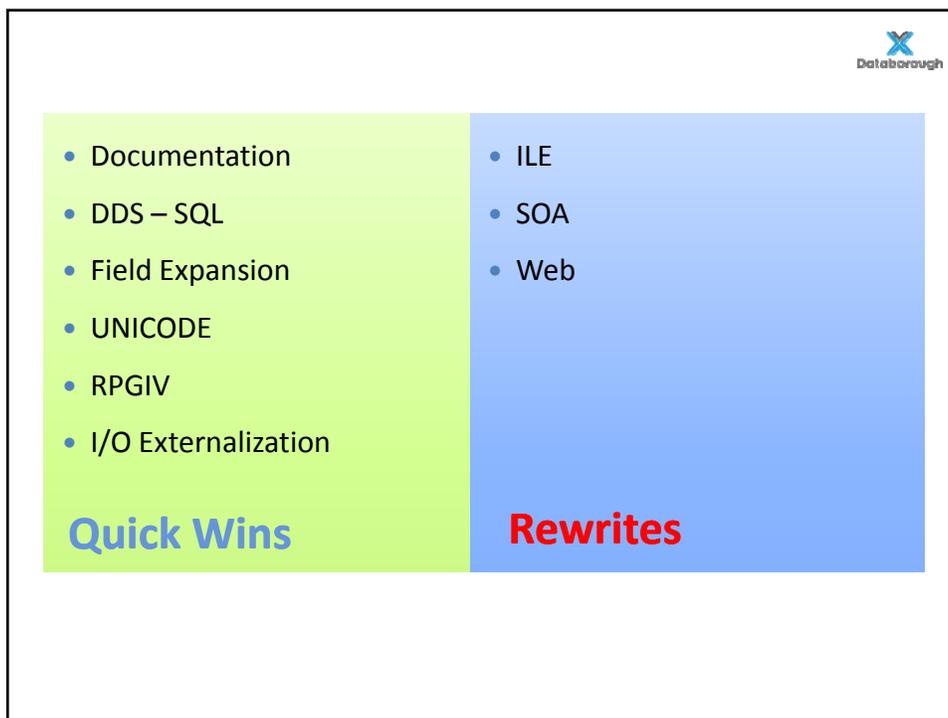

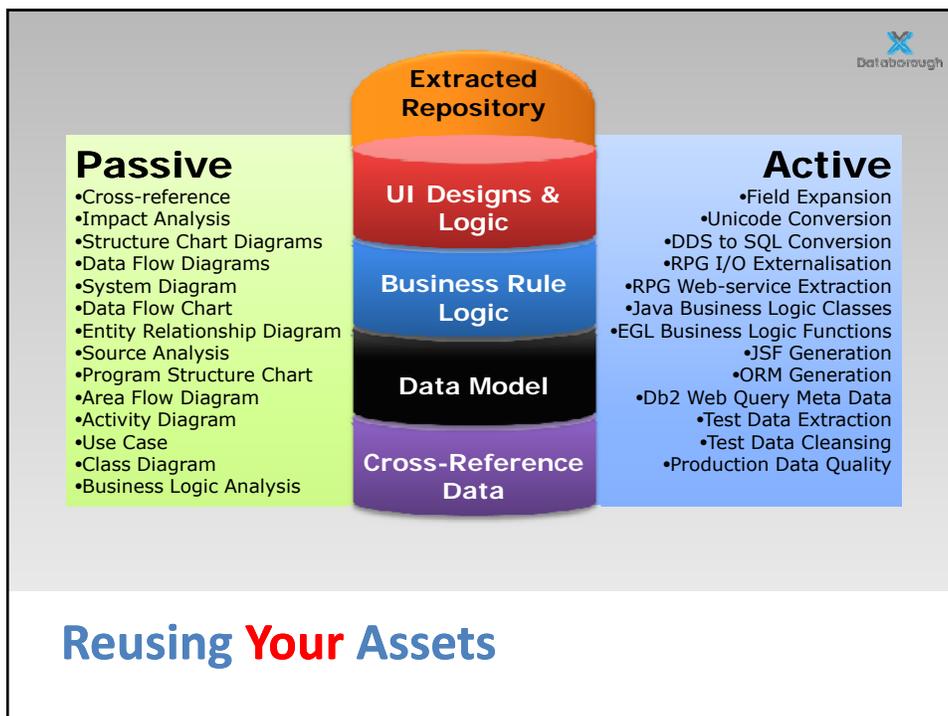

Engineered Approach

- Human Error
- Freeze Development
- Single Shot
- More Testing
- Labor Intensive

- One small change per pass
- Design Flexibility
- Repeatable
- Last Minute Changes
- Re-Usable

Automation

- 600 Plus projects
- Multi-Level Impact Analysis
- Case/Type Search Algorithms
- Case/Type Replacement Algorithms
- Exception Reporting

Case Studies – Y2K/Field Expansion/Euro/UNICODE

- Worldwide Insurance Company
- Million plus lines of code
- Integration with new package solution
- Need to use/update two sets of masters/transactions
- Automatically externalized RPG i/o into procedures/modules
- Change RLA into Callp's

Case Studies – Externalize i/o

- Large ERP system
- 55 Million Lines of code
- CA 2E & RPG
- Transforming into new application framework
- Auto Extract Business Logic and Data Model
- Generate documentation and XMI & DDL
- Import into new frameworks/tooling(Borland)

Case Studies - Design Extraction

- Large Financial Institution (Texas)
- Large database with heavy batch I/O processes
- DDS database
- Rewriting core processes
- Auto-Converted DD S to DDL and added security/constraint logic to DB

Case Studies - Database Modernization

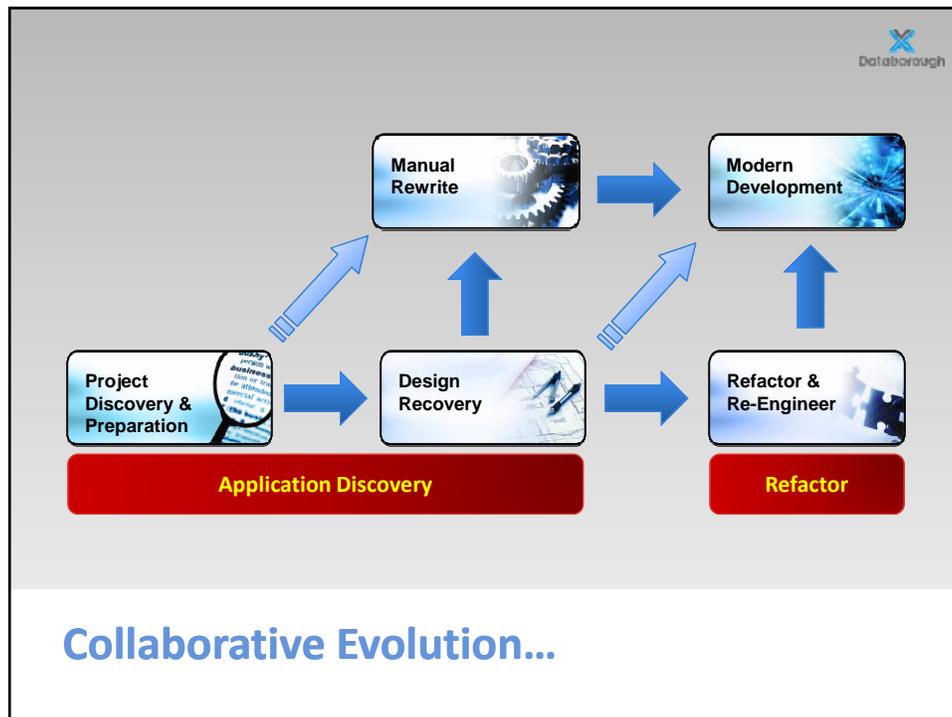

- Document
- Analyze
- Design & Plan
- Automation
- Rewrites

Summary

- **Accurately Measuring Impact of change**
accurate, current detailed, inferred and abstracted
- **Consistent & Current Information Sharing**
“even the most experienced developers need to communicate effectively”
- **Controlling Knowledge Loss**
systems become increasingly riskier and difficult to maintain
- **Education & Inclusion**
visualizing application design broadens user base(QA/Testing/non-400)
- **Design Recovery**
business rules, data models, process models, meta-data models
- **Automated System Re-engineering**
Field expansion, UNICODE, refactoring, I/O Externalization, Java, .Net

Improving Development Quality **AND** Reducing Cost

- “We reduced our impact analysis from 4 weeks to 11 seconds.” Mark Rinker – Mapics
- “We saved close to a million dollars on the first projects” Chris Nickchen – New Penn
- “the key to unlocking the promise of both [web 2.0 and SOA] lies in leveraging of legacy business logic.” Ted Tritchew – Infor
- “[this] has provided a fundamental capability to increase quality and timeliness in development and support.” Mike Qusted - Fiserv
- “This helped us take complete control of our legacy applications, and has improved the quality of the development process through understanding and knowledge.” Julie Hollis – Davies Turner
